

Microsoft®
Forefront™
Protection Suite

Comprehensive protection for endpoints, messaging, and collaboration

Microsoft® Forefront™ Protection Suite, formerly known as the Forefront Security Suite, offers a powerful combination of on-premises and in-the-cloud security solutions to deliver comprehensive protection against malware and inappropriate content across endpoints, servers, and the network edge. In addition to the upfront cost savings associated with purchasing the suite, customers also benefit from simplified licensing and support.

The Suite Advantage: Delivering Comprehensive Protection for Your Business

Forefront Protection Suite provides end-to-end protection for your IT infrastructure, reduces ongoing costs, and simplifies licensing. It includes:

- Microsoft Forefront Client Security
- Microsoft Forefront Threat Management Gateway Web Protection Service
- Microsoft Forefront Protection 2010 for Exchange Server
- Microsoft Forefront Online Protection for Exchange
- Microsoft Forefront Security for Office Communications Server
- Microsoft Forefront Security for SharePoint®

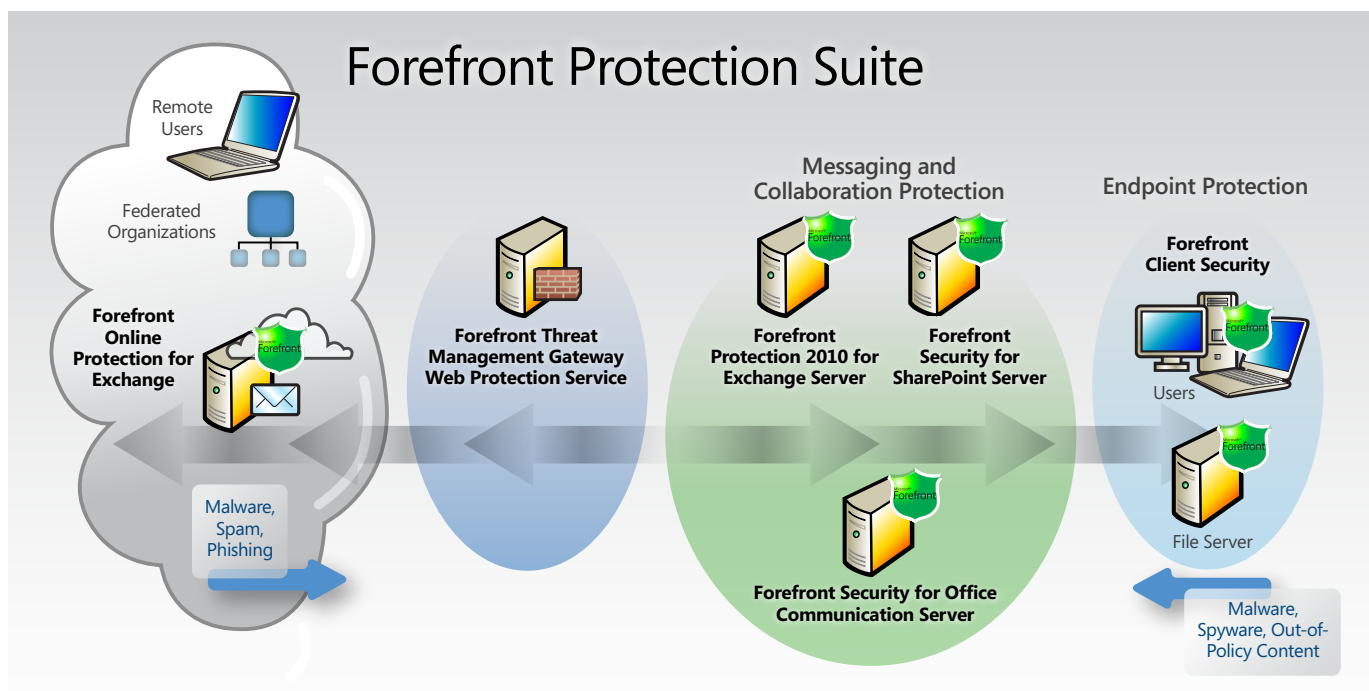

Comprehensive protection

Defends endpoints in real time against complex and emerging threats

- Provides real-time endpoint protection against threats using an integrated antivirus/antispysware engine.
- Prevents users from visiting Web sites that harbor malicious content or do not comply with corporate policy.

Protects e-mail and instant messaging against malware, spam, and inappropriate content

- Best-in-class detection and response with multiple scan engines from Microsoft and industry-leading partners.
- Provides on-premises and cloud-based antispam protection through aggregated reputation services and content filtering.
- Blocks dangerous file types and content containing sensitive or inappropriate key words.

Secures collaboration while preventing unauthorized use of confidential information

- Integrates multiple scan engines to provide real-time protection against malware without impeding the performance or integrity of the document library.
- Eliminates the sharing of inappropriate language in both internal and external communications, including IRM-protected documents.

Reduced costs

Integrates with existing Microsoft infrastructure

Forefront Protection Suite enables easier, less expensive deployments through integration with Windows® operating systems and core workloads such as Exchange and SharePoint. Suite products also work with your existing Microsoft environment, including Microsoft Systems Center Operations Manager, SQL Server®, Active Directory®, Windows Server® Update Services (WSUS), and Network Access Protection (NAP).

Simplifies acquiring and deploying multiple security products

- Saves customers around 30 percent over purchasing products separately.
- Eliminates many redundant configuration and deployment steps that customers experience with a multivendor, point-product deployment approach while providing a complete, defense-in-depth solution.

Lowers training costs

Administrators trained on one solution can easily apply the same skills to all of the products in the suite, so it cuts the need for training on solutions with multiple individual products.

Simplified licensing

Simplifies licensing purchase, management, and renewal

One license for the entire security solution eases license tracking and management. Customers get automatic ongoing access to the latest versions of all products in the suite.

Delivers the efficiencies of a single vendor relationship

Suite customers can deal with a single vendor (Microsoft) to address client, server, messaging, and collaboration security needs.

Licensing Options

Licensing for Forefront Protection Suite varies in the amount of investment customers have or plan to make in the Microsoft platform, as well as the breadth of the solutions they are building. Forefront Protection Suite can be licensed as:

- An individual SKU, for customers who want the full breadth of protection offered, but who may not need the complete range of infrastructure offerings provided in ECAL.
- Part of the Enterprise CAL (ECAL) Suite, for customers who have invested, or plan to invest, in the Microsoft platform throughout the IT infrastructure. Savings can be as great as 50 percent over products purchased individually.

Forefront Protection Suite	
Secure endpoint	
Forefront Client Security	Delivers integrated malware protection for desktops, laptops, and servers that is easy to manage and control.
NEW Forefront Threat Management Gateway (TMG) Web Protection Service	Provides continuous updates for malware filtering and access to cloud-based URL filtering technologies aggregated from multiple security vendors to protect against the latest Web-based threats. (Requires Forefront TMG 2010 server, licensed separately.)
Secure messaging	
NEW Forefront Protection 2010 for Exchange Server	Integrates multiple scanning engines from industry-leading partners to offer fast and effective detection of viruses, worms, and spyware to protect on-premises Microsoft Exchange Server environments.
NEW Forefront Online Protection for Exchange Server	Offers a cloud-based filtering service that helps protect inbound and outbound e-mail traffic from spam (including phishing scams), viruses, and policy violations, blocking most before they even approach the network edge.
Forefront Security for Office Communications Server	Scans instant message conversations and file transfers for viruses, and filters inappropriate content using multiple scanning engines from industry-leading security partners.
Secure collaboration	
Forefront Security for SharePoint	Protects Microsoft Office SharePoint libraries against documents containing malicious code, unauthorized confidential information, and inappropriate content.
